

HT Roll turner with a pneumatically expanding shaft for 3" rolls with manual turning

*The roller turners are available in two variants -
One for loads up to 120 kg and a smaller variant for loads of max 100 kg*

The roll turner is adapted to the size of the rolls, so that it is basically weightless. Rotation occurs simply by pulling the handle at the end of the roll turner's bow. The arc runs easily through ball-bearing rollers.

The roll turner retrieves and lifts rolls through and the expander is inserted vertically into the roll. The expander grips with the help of protruding rubber lugs. The roll is then lifted up and can be easily and manually rotated to a horizontal position.

Guide the expander into the sleeve.
If necessary, adjust the depth stop so that the relevant roller is balanced in the center of rotation.

Activate the pneumatics by pressing the button - the roller is locked.
Holding force. 6 kg / 10 mm expander with rubber strip.

Raise the roller to an ergonomic height.

Grasp the handles and turn the roller to a horizontal position.

Transport to unloading point.
Make sure the roll is secured when dropped off.
